Recent Advances in Green Catalysis

Chun-Chen Liao

**Department of Chemistry, Chung Yuan Christian University
Chungli 32023, TAIWAN**

永續合成工作坊

Taipei, 2010.02.01

主辦單位
中國化學會環境與化學委員會
國科會化學研究推動中心

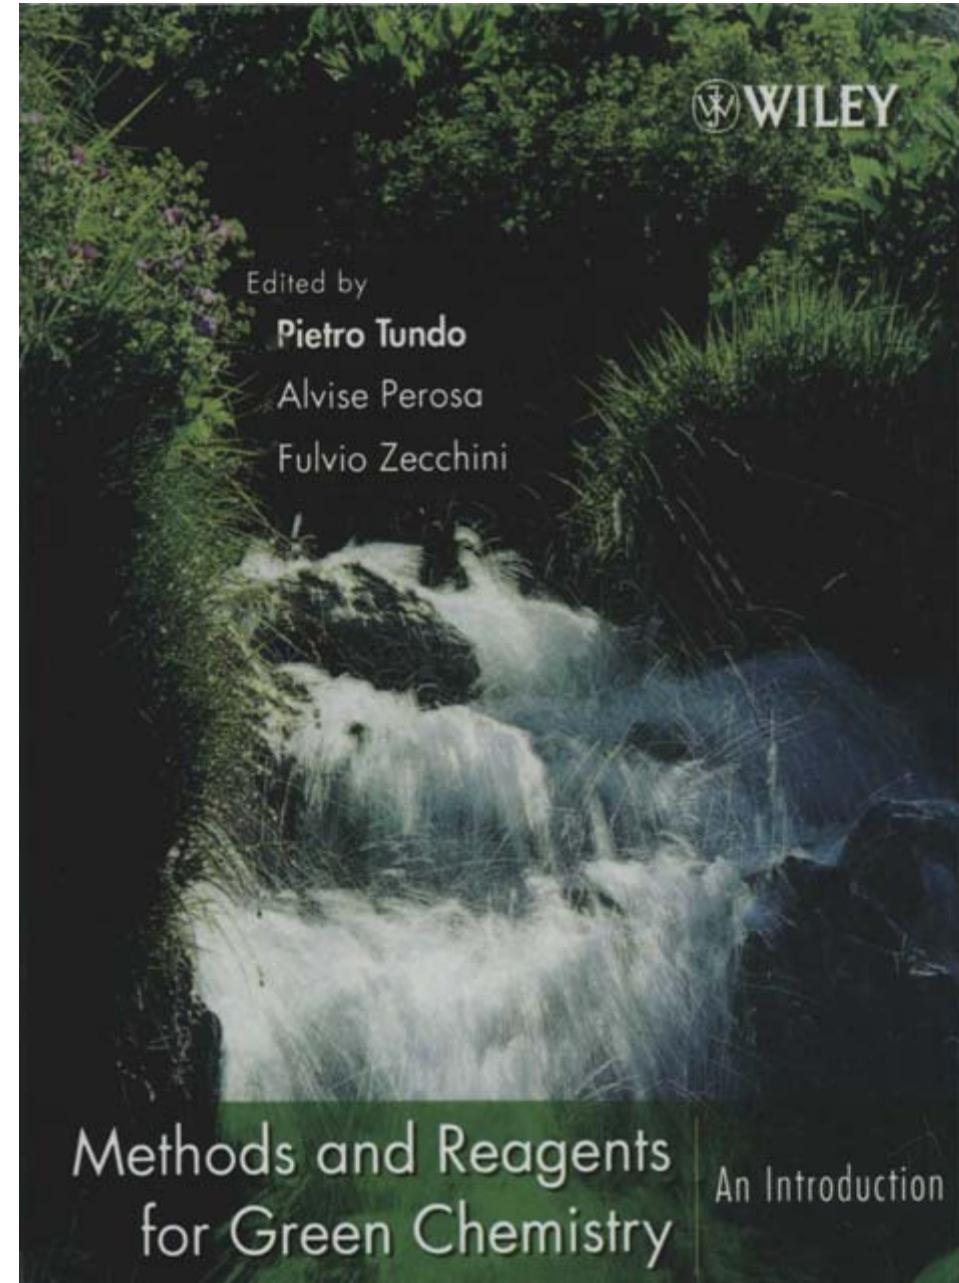

第七次全國科學技術會議

討論議題一：發展特色研究領域

- (一) 強化海洋科技研究
- (二) 發展綠色科技研究
- (三) 強化跨領域尖端研究能力

Green Chemistry

**Technologies that
efficiently utilize energy
and raw materials and
reduce, or preferably,
eliminate, the generation
of waste and avoid the
use of toxic and /or
hazardous reagents, and
solvents.**

Condensed Principles of Green Chemistry

Twelve principles of green chemistry written in the form of a mnemonic: PRODUCTIVELY

P – Prevent wastes

R – Renewable materials

O – Omit derivatization steps

D – Degradable chemical products

U – Use safe synthetic methods

C – Catalytic reagents

T – Temperature, Pressure ambient

I – In-Process Monitoring

V – Very few auxiliary substances

E – E-factor, maximize feed in product

L – Low toxicity of chemical products

Y – Yes, it is safe

S. L. Y. Tang, R. L. Smith, M. Poliakoff, *Green Chem.*, 2005, 7, 761-762

Atom Economy (Atom Efficiency)

% Atom Economy =

$$\left(\frac{\text{molecular weight of desired product}}{\text{molecular weight of all reactants}} \right) \times 100$$

The E - Factor

A useful measures of the potential environmental impact of chemical processes is the *E*-factor.

$$E = (\text{Raw materials} - \text{Product}) / \text{Product}$$

E-Factors for Different Segments of the Chemical Industry

Industry Segment	Production (in tons)	E-Factor kg Waste / kg Product
Bulk chemicals	$10^4\text{-}10^6$	< 1 - 5
Fine chemicals	$10^2\text{-}10^4$	5 - 50
Pharmaceuticals	$10\text{ - }10^3$	25 - >100

R. A. Sheldon, Chem. Ind, 1997, 12; 1992, 903.

Where do all the wastes originate?

1. Stoichiometric Brønsted acids and bases:

- *Aromatic Nitrations with H_2SO_4 / HNO_3*
- *Acid promoted rearrangements, e.g. Beckmann (H_2SO_4)*
- *Base promoted condensations, e.g. Aldol ($NaOH, NaOMe$)*

2. Stoichiometric Lewis acids:

- *Friedel-Crafts acylation ($AlCl_3, ZnCl_2, BF_3$)*

3. Stoichiometric oxidants and reductants:

- *$Na_2Cr_2O_7, KMnO_4, MnO_2$*
- *$LiAlH_4, NaBH_4, Zn, Fe/HCl$*

4. Halogenation and Halogen replacement:

- *Nucleophilic substitutions*

5. Solvent losses:

- *Air emissions and aqueous effluent*

Nature of Green Solvents

having...

- **Low toxicity**
- **Easy recyclability (No disposal)**
- **Further desirable characteristics :
easy removal from the product and low
reactivity.**

Solvents

that can be used if unavoidable: hexane, toluene, dichloromethane, dioxane, pyridine, methanol,...

Preferred solvents: water, scCO₂, heptane, *tert*-butyl methyl ether, ethyl acetate, *tert*-butyl alcohol, ethanol, ...

Ref: FDA, Q3C-Tables and List

(www.fda.gov/cder/guidance/index.htm)

Restrictions on Solvent Use in the Pharma Industry

**Driving force:
exposure of the user to residual solvents.**

**Solvents that should never be used :
benzene, carbon tetrachloride,
1,2-dichloroethane, 1,1-dichloroethane,**

Water as a Solvent

Advantages

- Economically & Environmentally attractive
- Inexpensive and abundantly available
- Non-inflammable and non-toxic
- Odorless & colorless
- Highly polar reaction medium
- Novel reactivity of organometallic complexes
- Facile product separation/catalyst recycling
- Reduced product contamination

Catalysis

**Brønsted Acid-Base Catalysis
Lewis Acid-Base Catalysis
Transition-metal catalysis
Organocatalysis
Photocatalysis
Asymmetric Catalysis
Biocatalysis**

Handbook of Green Chemistry

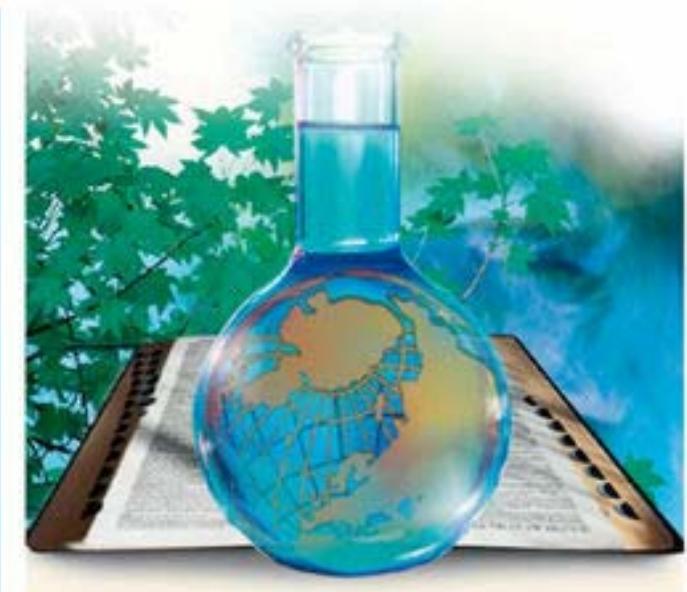

Edited by Paul T. Anastas

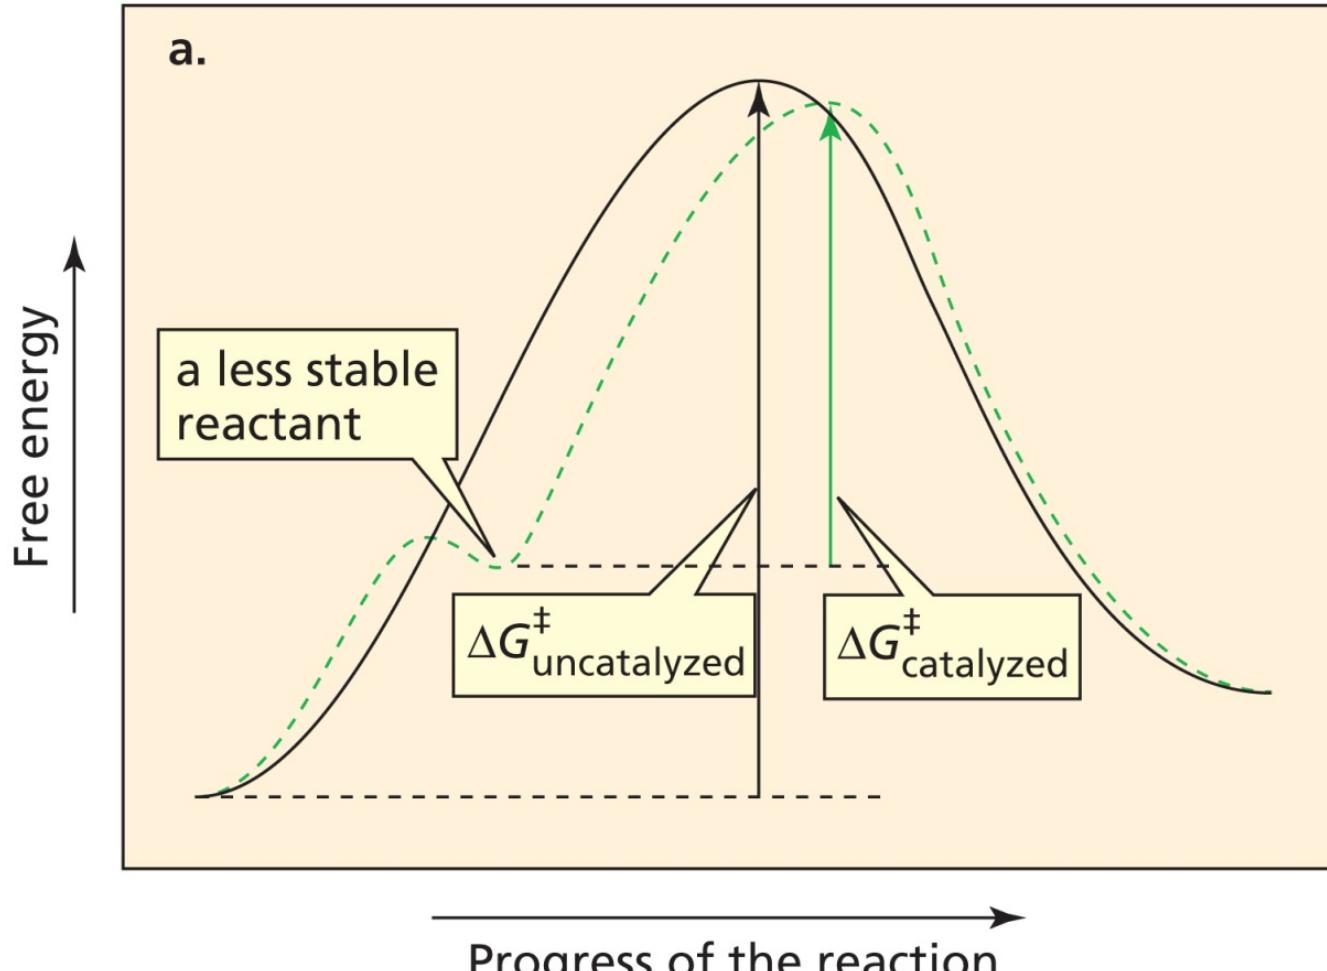

WILEY-VCH

Green Catalysis

Volume 1: Homogeneous Catalysis

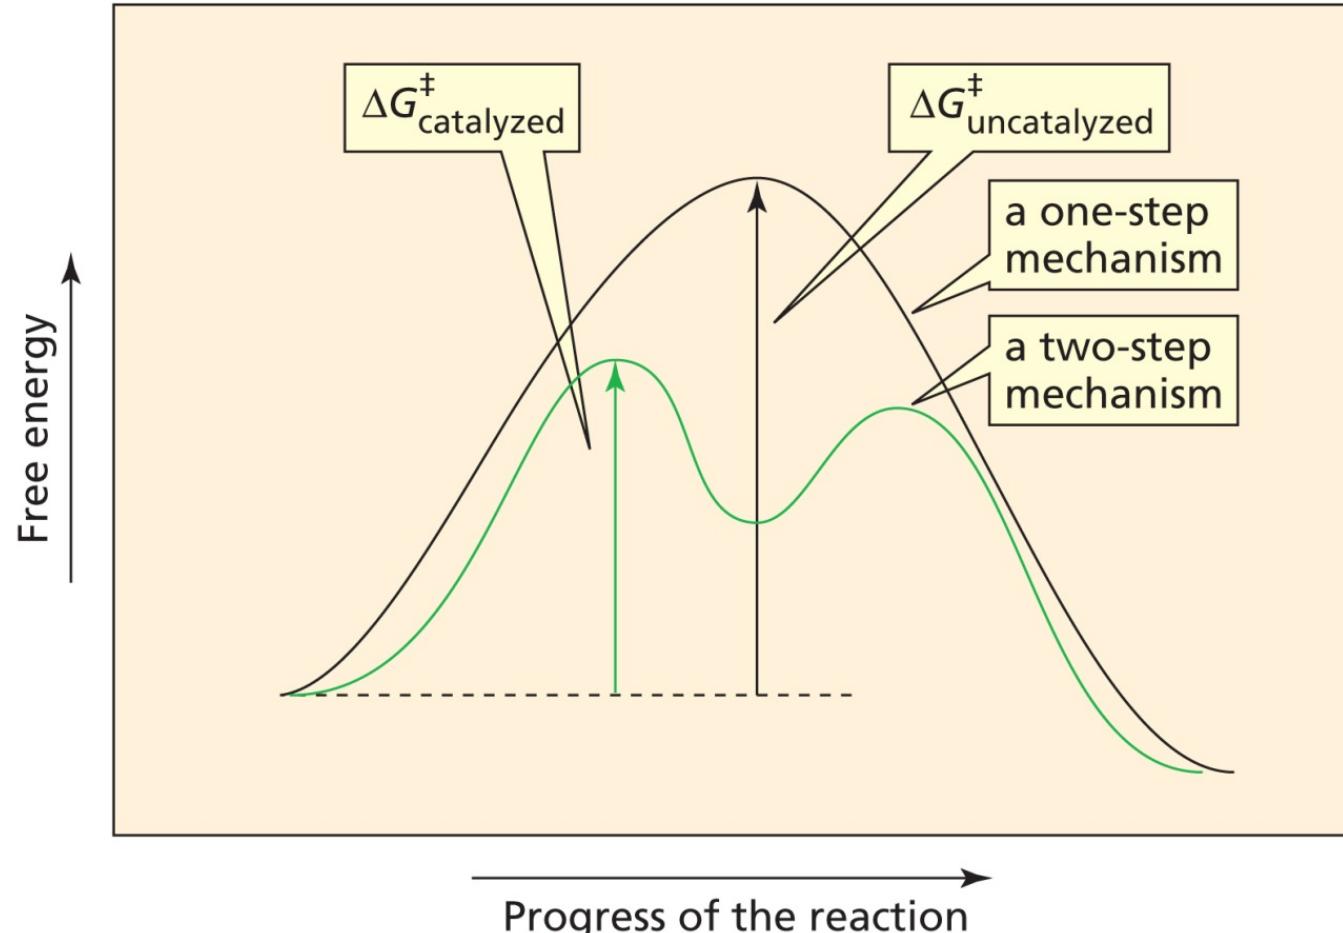

Volume Editor:
Robert H. Crabtree

Copyright © 2007 Pearson Prentice Hall, Inc.

The catalyzed and uncatalyzed reactions can have different, but similar, mechanisms, with the catalyst providing a way to convert the reactant into a less stable species

Copyright © 2007 Pearson Prentice Hall, Inc.

The catalyst can completely change the mechanism of the reaction, providing an alternative pathway with a smaller free energy of activation than that of the uncatalyzed reaction.

Catalysis in Organic Reactions

- It can provide a new reaction route.
- It can increase the stability of a transition state.
- It can increase the reactivity of a nucleophile.
- It can increase the susceptibility of an electrophile to nucleophilic attack.
- It can increase the leaving ability of a group by converting it into a weaker base.

Homogeneous vs. Heterogeneous Catalysis

Homogeneous

Advantages

- Mild reaction conditions
- High reactivity and selectivity
- Efficient heat transfer

Disadvantages

- Cumbersome separation and recycling of catalyst
- Product contamination

Heterogeneous

- Facile separation of catalyst and products
- Continuous processing

- Heat transfer problems
- Low reactivity and selectivity

The Role of Green Catalysis

The increasing use of catalytic processes can substantially reduce waste at the source, resulting in primary pollution prevention.

Stoichiometric vs. Catalytic Oxidation

Stoichiometric: (The Jones oxidation)

$$\text{Atom efficiency} = 120 \times 3 / 122 \times 3 + 100 \times 2 + 98 \times 3 = 360 / 860 = 42 \%$$

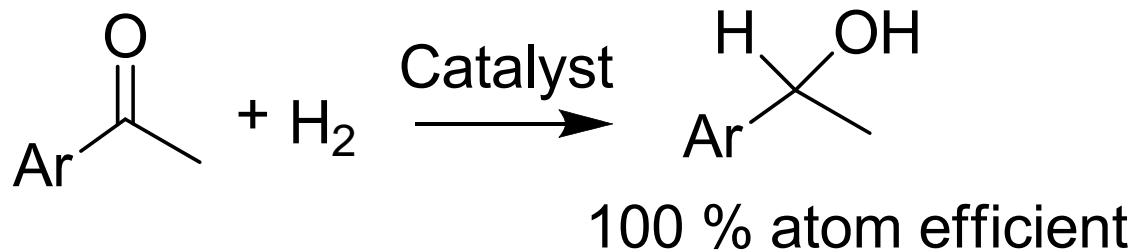

Catalytic:

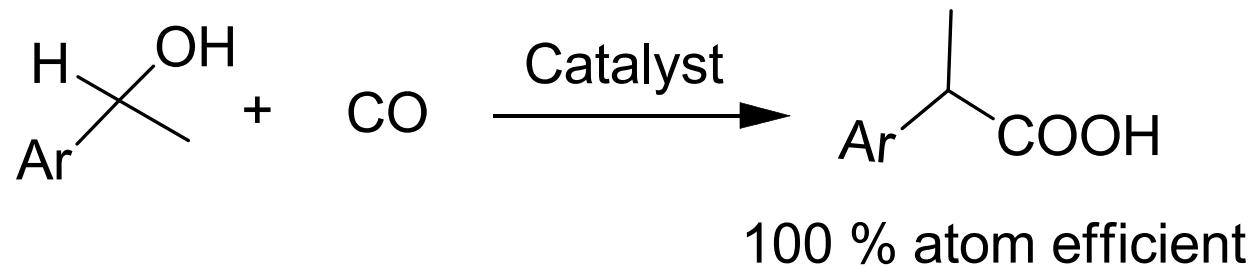

$$\text{Atom efficiency} = 120 / 122 + 16 = 120 / 138 = 87\%$$

Atom-efficient Catalytic Processes

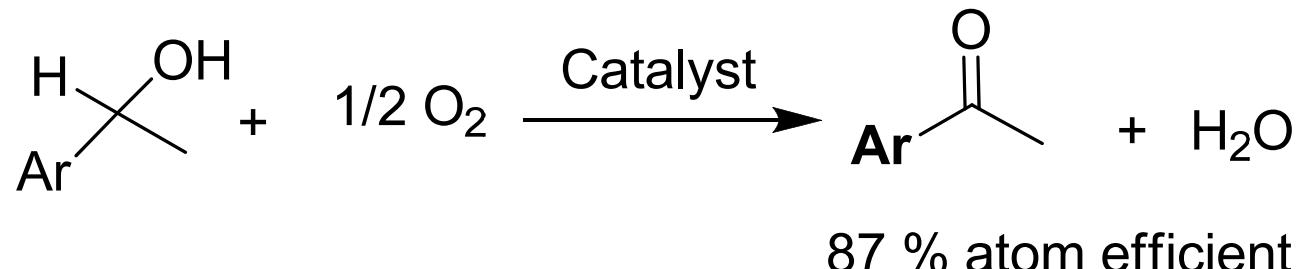

Hydrogenation:

Carbonylation:

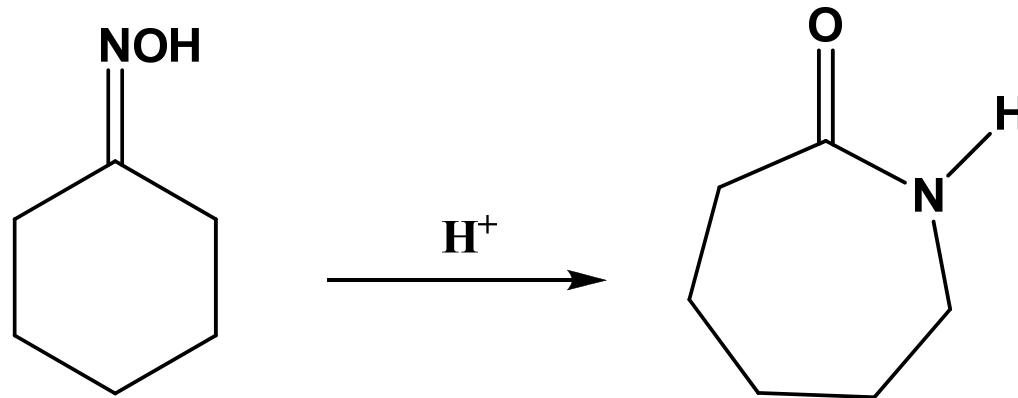

Oxidation:

Ar = Phenyl

Caprolactam Formation

Brønsted Acid Catalysis

Lewis Acid Catalysis

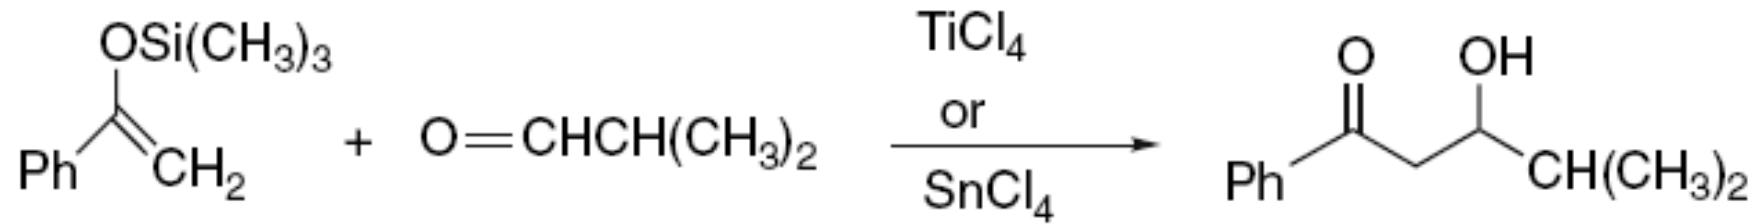

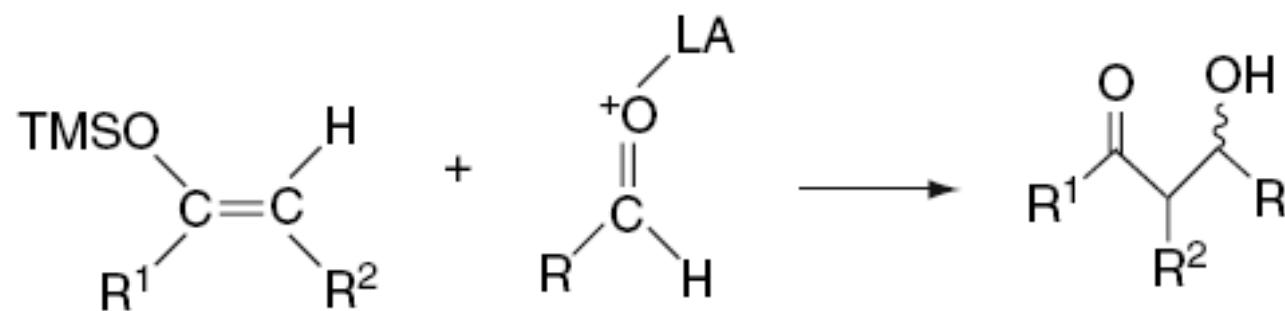

Initial coordination of a Lewis acid occurs to the basic site of the substrate.

The Lewis acid plays the key role to determine the overall reaction path by controlling the generation and trapping of the cationic species.

The Lewis acid decides also the nature of the cationic species generated, an ion pair or a loosely bound covalent species or somewhere in-between.

Lewis acid-base catalysis reactions are becoming of increasing importance in current organic synthesis

The Mukaiyama Aldol Reaction

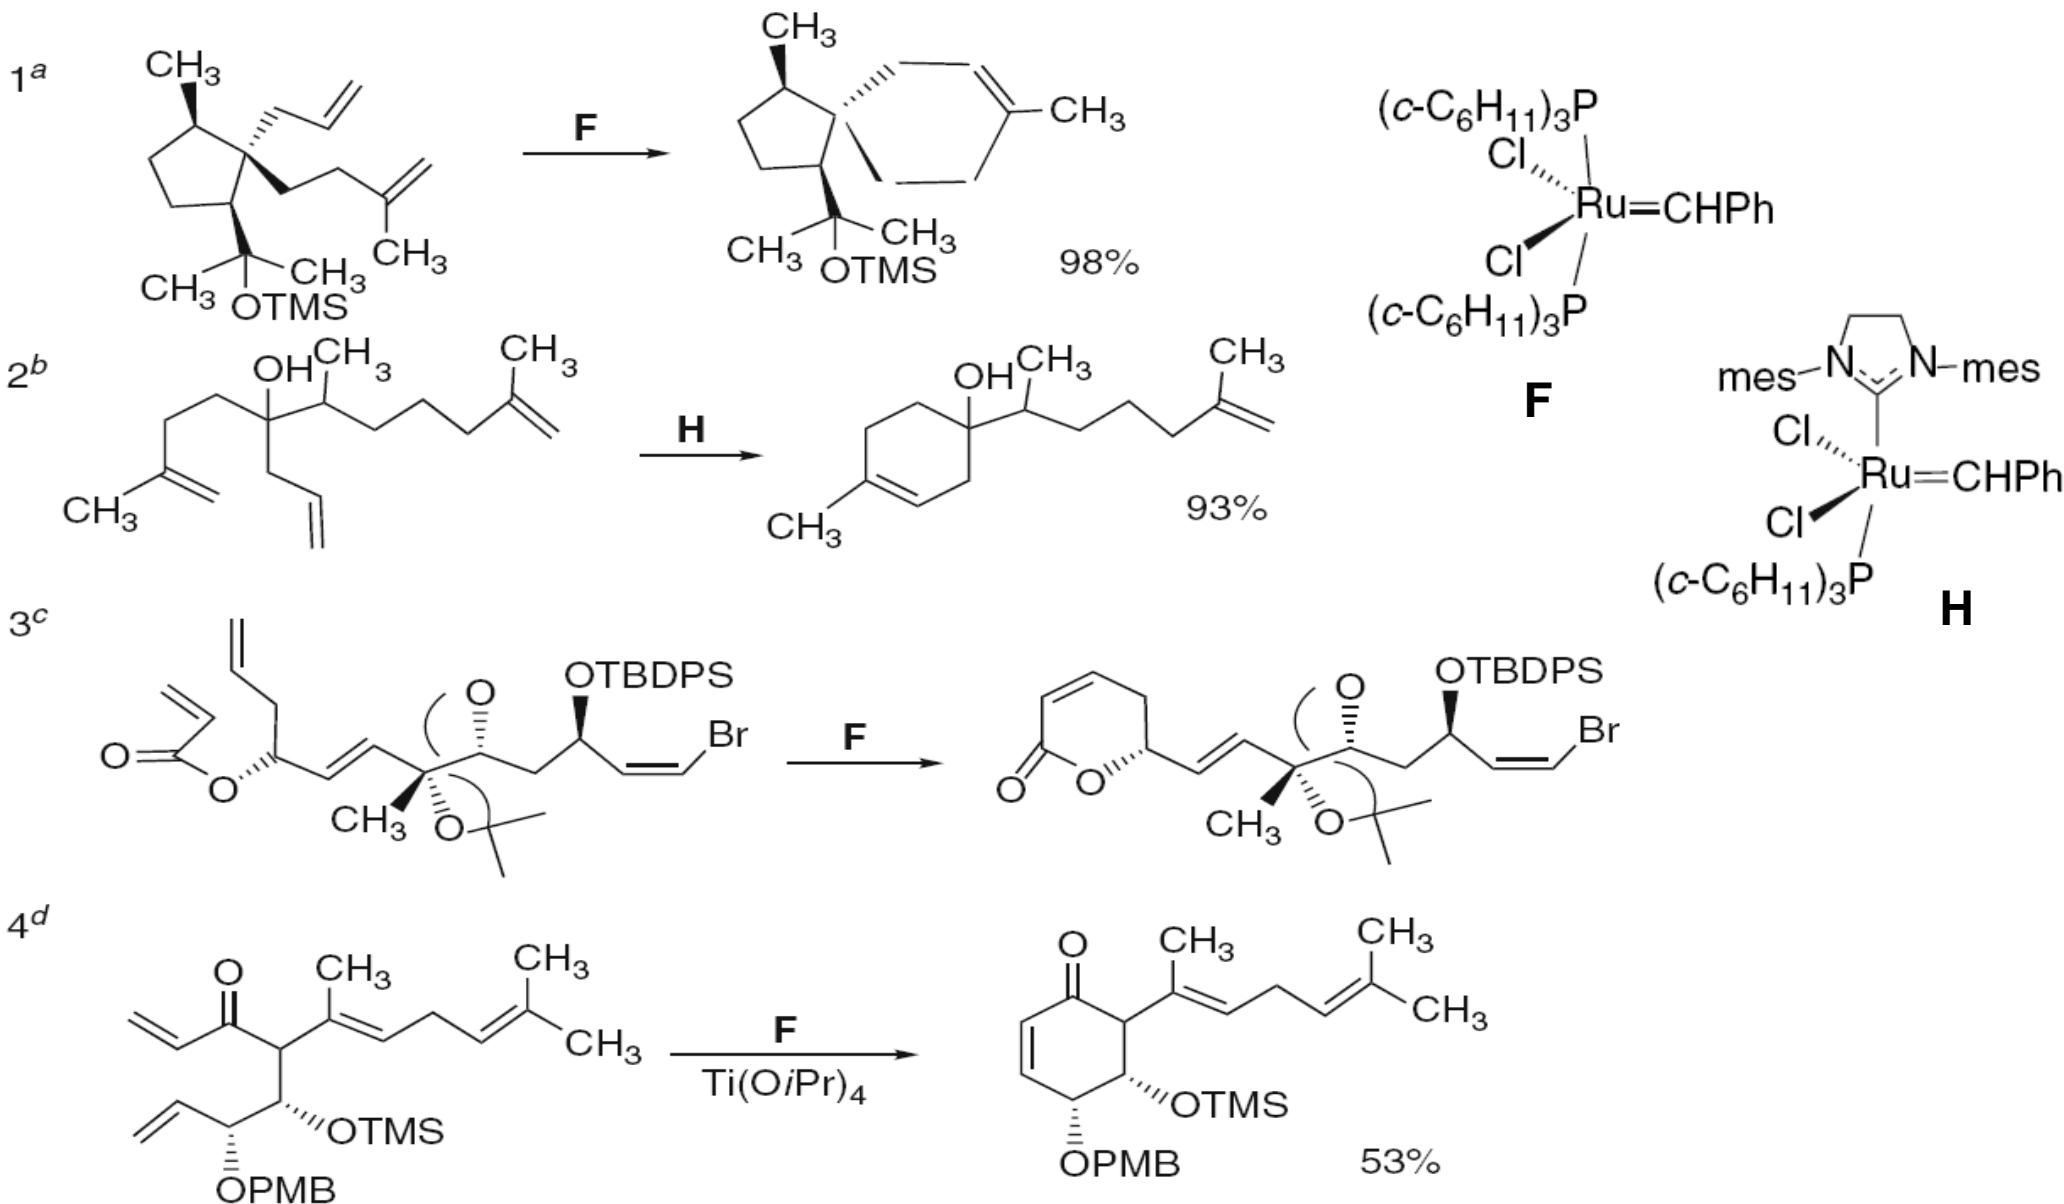

Metathesis

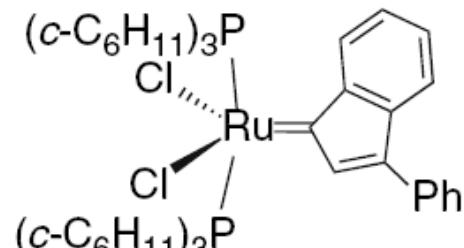

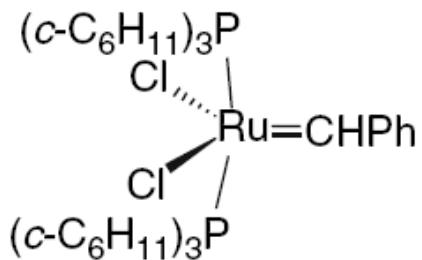

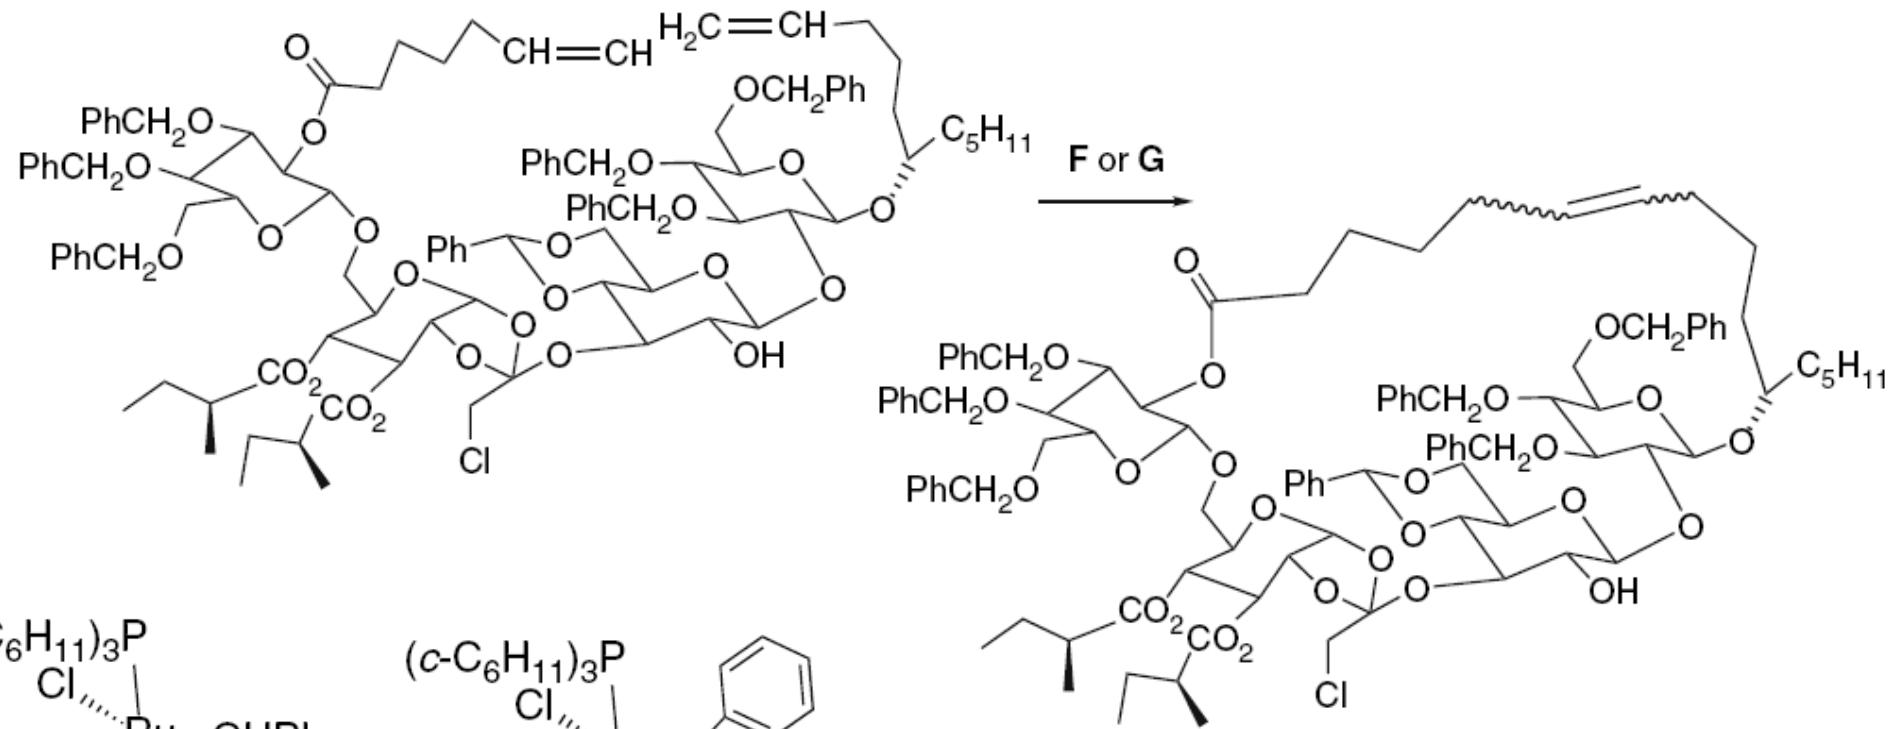

- **Yves Chauvin, Richard Schrock, and Robert Grubbs**
- more efficient (fewer reaction steps, fewer resources required, less wastage),
- simpler to use (stable in air, at normal temperatures and pressures) and
- environmentally friendlier (non-injurious solvents, less hazardous waste products).
- This represents a great step forward for "green chemistry", reducing potentially hazardous waste through smarter production. Metathesis is an example of how important basic science has been applied for the benefit of man, society and the environment.

The Olefin Metathesis Reaction

The Olefin Metathesis Reaction

Production of Acetic Acid from Methanol and Carbon Monoxide

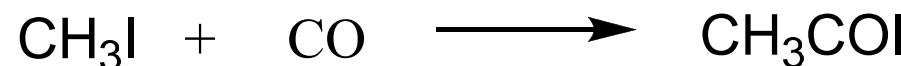

$\Delta H = -136.6 \text{ kJ/mol}$

Brønsted Acid Catalysis

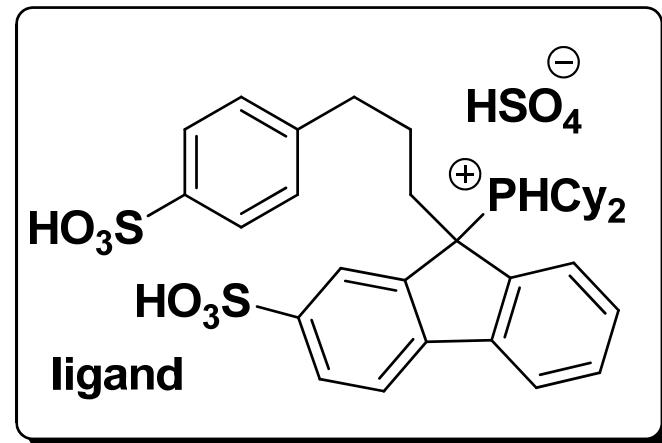

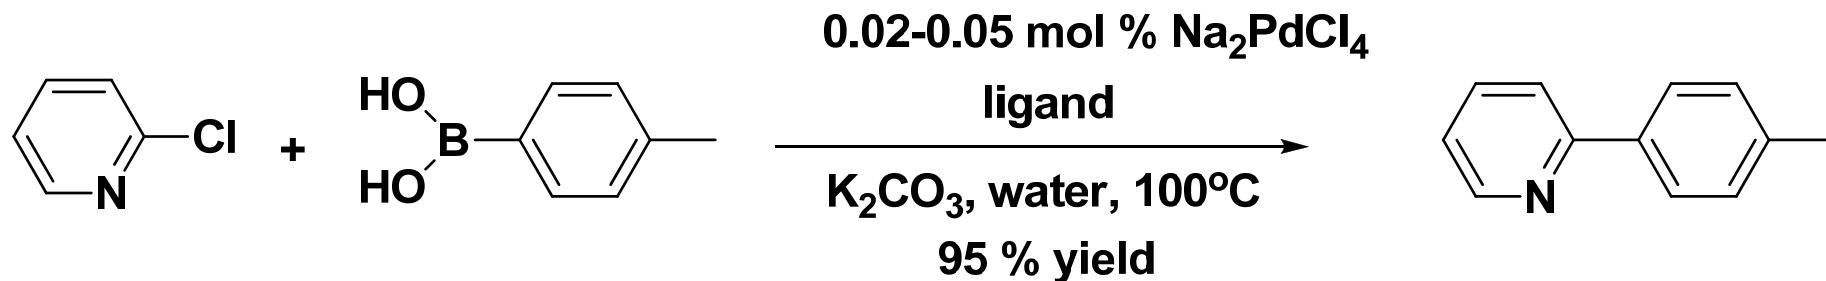

Transition-metal catalysis

Hydrolysis

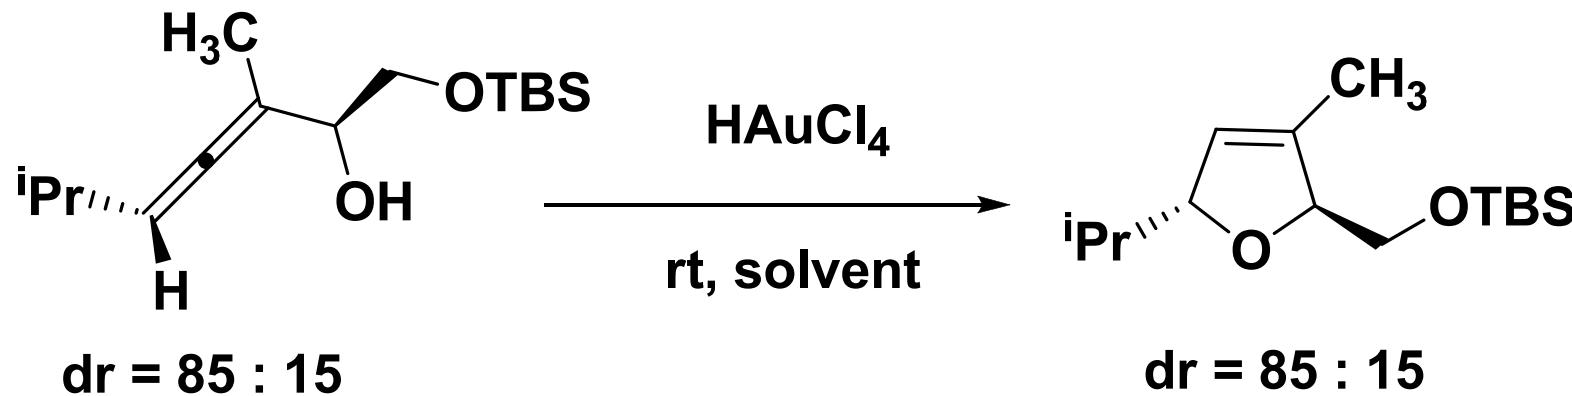

Suzuki-Miyaura Coupling in Water

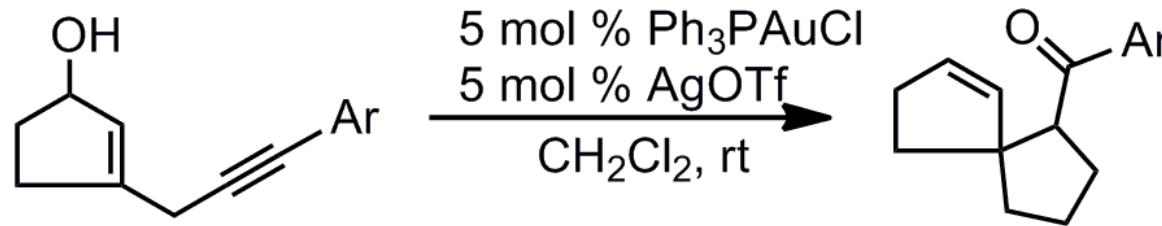

C. A. Fleckenstien, H. plenio, *Green Chem.*, 2007, 9, 1287-1291.

Chloroauric Acid (HAuCl_4)-catalyzed Reaction in Water

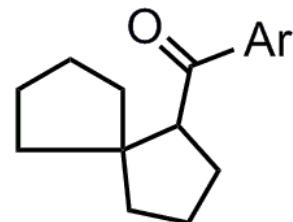

solvent	catalyst loading (mol %)	time	yield %
water (10 mL)	5	2.5 h	78
water (10 mL)	10	1 h	58
water (10 mL)	1	5 h	43

Gold(I)-Catalyzed Synthesis

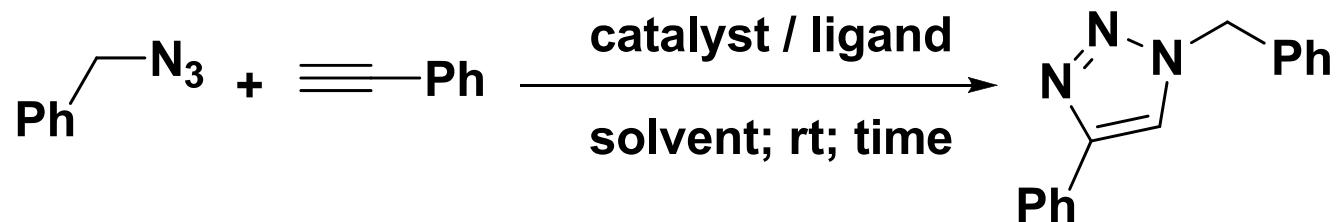

de ratio = 1:1

10 mol % Ph_2S
10 mol % Pd/C (5 wt 5)
EtOH, H_2 (1 atm)
rt, 24 h

Click Reaction in Water

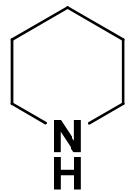

catalyst / ligand	solvent	time	yield %
5 mol % CuBr / 30 mol % PhSMe	t- BuOH	1 h	< 5
5 mol % CuBr / 30 mol % PhSMe	t- BuOH / H ₂ O (1:2)	10 min	50
5 mol % CuBr / 30 mol % PhSMe	H ₂ O	5 min	96
10 mol % CuBr / 30 mol % PhSMe	H ₂ O	5 min	97

What is Organocatalysis?

- A concatenation of the terms “organic” and “catalyst”
- In organic chemistry the term Organocatalysis refers to a form of catalysis, whereby the rate of a chemical reaction is increased by an organic catalyst consisting (mainly) of carbon, hydrogen, sulfur, nitrogen, oxygen, and phosphorus.
- Metal free catalysis

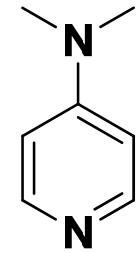

Achiral and Chiral Organocatalysts

Piperidine

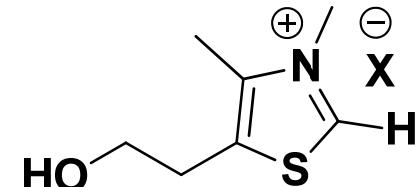

DABCO

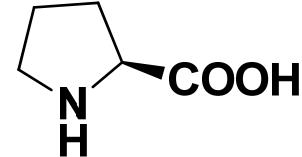

DMAP

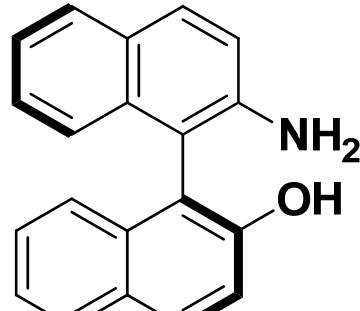

hydrogen cyanide

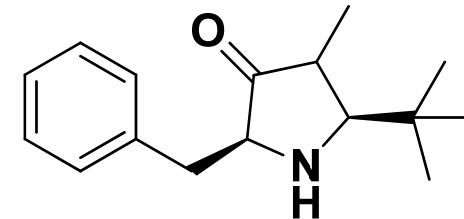

thiazolium salts

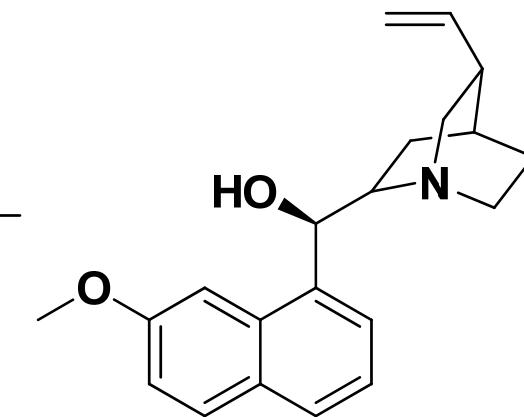

L-Proline

Nobin

Macmillan's catalyst

Quinine

Primary Attractions of Organocatalysis

- Readily available**
- Non-toxic (environmentally benign)**
- Inexpensive compared to Metal-based catalysts**
- Inertness towards moisture and oxygen**

Primary Attractions of Organocatalysis (continued)

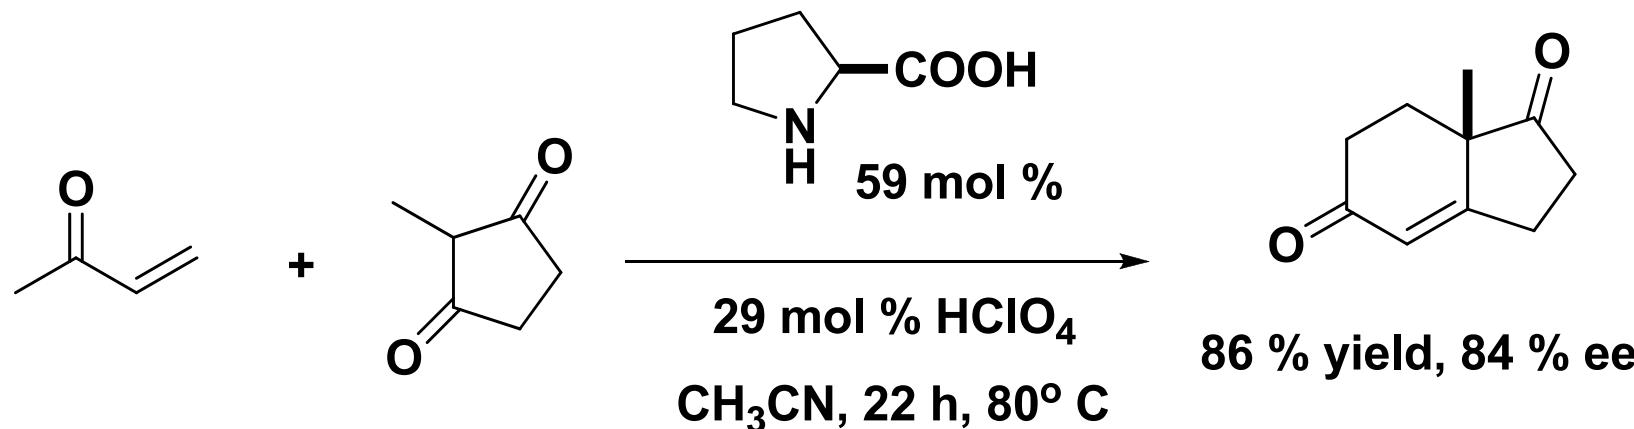

- Demanding reaction conditions (inert atmosphere, low temperatures, absolute solvents, etc.,) are usually not required
- Absence of transition metals, attractive for synthesis of non-toxic - pharmaceutical and agrochemical products
- Biomimetic - Induce cascade reactions

Comparison with Conventional Catalysis

Type	Advantages	Disadvantages
Organometallic Catalysis	Wide substrate scope high catalytic activity	Tedious process, potential heavy metal pollution
Enzyme Catalysis	High selectivity and catalytic activity	Limited substrate scope usually single enantiomer
Organocatalysis	Simple structure, inexpensive, natural molecules, nontoxic	No

Robinson Annulation

Early Organocatalysis:

Eder et al. *Angew. Chem. Int. Ed.* 1971, 10, 496-497

Z. Hajos, D. Parrish, *J. Org. Chem.* 1974, 39, 1615-1621

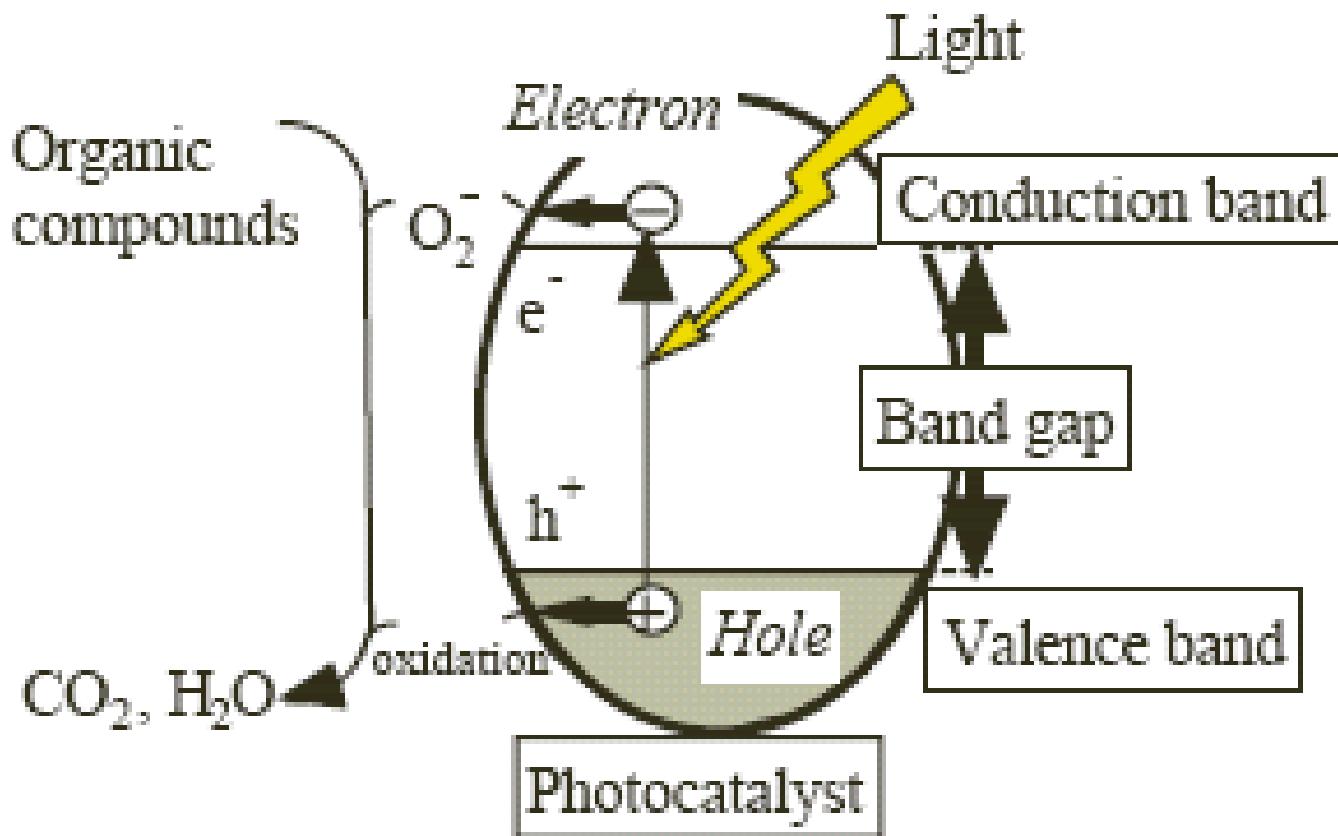

Photocatalysis

The phenomenon by which a relatively small amount of light-absorbing material, called a photocatalyst, changes the rate of chemical reaction without itself being consumed.

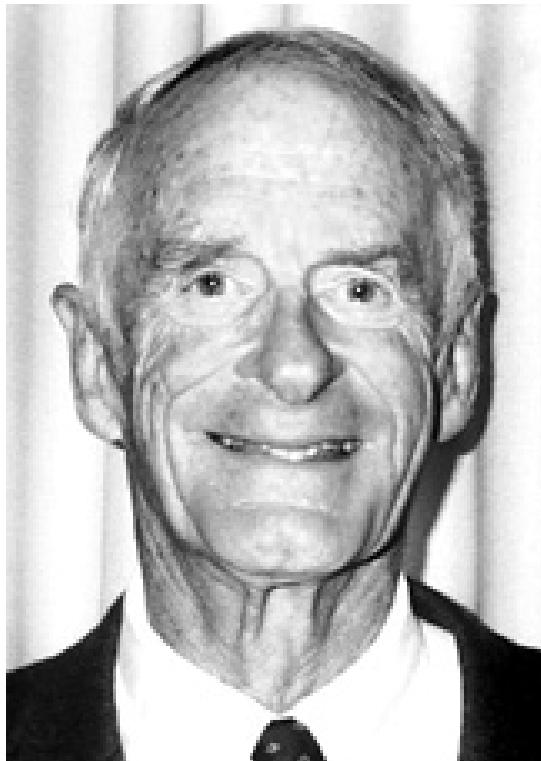

Photocatalysis by TiO_2 has been investigated for decades since the first report by Fujishima and Honda in 1972.

A. Fujishima, K.Honda, *Nature*, 1972, 238, 37-38.

Mechanism of Photocatalysis

Industrial Applications of Biocatalysts

Why Biocatalysis....?

- Mild conditions
- Ambient temperature
- Pressure and physiological pH
- Fewer steps (avoids protection/deprotection steps)
- Largely avoids toxic/hazardous reagents & solvents
- High chemo-, regio-, and stereoselectivities

D-Fructose-6-phosphate Aldolase-Catalyzed One-Pot Synthesis of Iminocyclitols

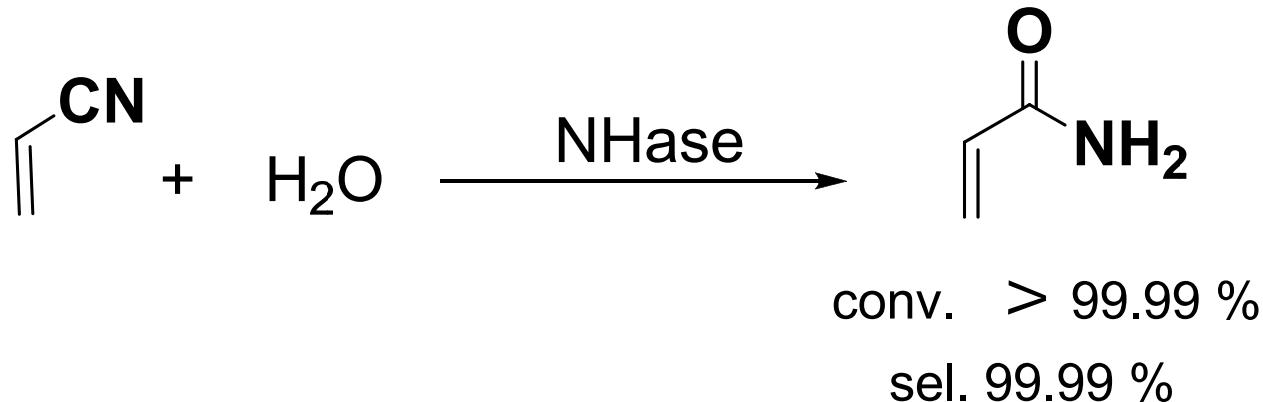

The Presidential Green Chemistry
Challenge Award 2000
Academic Award
*Enzymes in
Large-Scale Organic Synthesis*

M. Sugiyama, Z. Hong, P. H. Liang, S. M. Dean, L. J. Whalen, W. A. Greenberg, C. -H. Wong,

Biocatalytic production of Acrylamide

Mitsubishi

- 100,000 tons per annum and still increasing
- Simpler than chemical process (Cu-catalyst)
- Immobilized whole cells of *Rh. rhodocrous* J1
- Mild conditions (5 °C); no polymerization inhibitor needed
- high product quality.

Biocatalytic Hydrolysis of Nitriles

Immobilized whole cells of *P. chlororaphis* B23

Catalyst consumption 0.006 kg/kg product

Higher conversion/selectivity than chemical process (MnO_2 cat. / 130 °C)
